

Btrack Solutions to trial two new “Black Box” Road Safety Systems

Btrack Solutions is to trial two new “black box” devices which could be invaluable in proving proof of liability by recording video and forensic data in the event of road traffic accident. Mounted on the dashboard, the devices can buffer up to 14 seconds of data prior and 6 seconds after an accident including angle of impact and g-force. The devices are activated by sharp braking, hard cornering, rear or side impact. If the impact does not result in an accident, the unit will reset and overwrite the data.

A higher specification model will also warn drivers if they attempt to change lanes without indicating or pull away while a car in front has its brake lights illuminated.

The devices will be available in both installed and self install options and are likely to retail at a similar price to in car mid range portable Sat Nav systems.
